

Computer-Controlled Vehicle

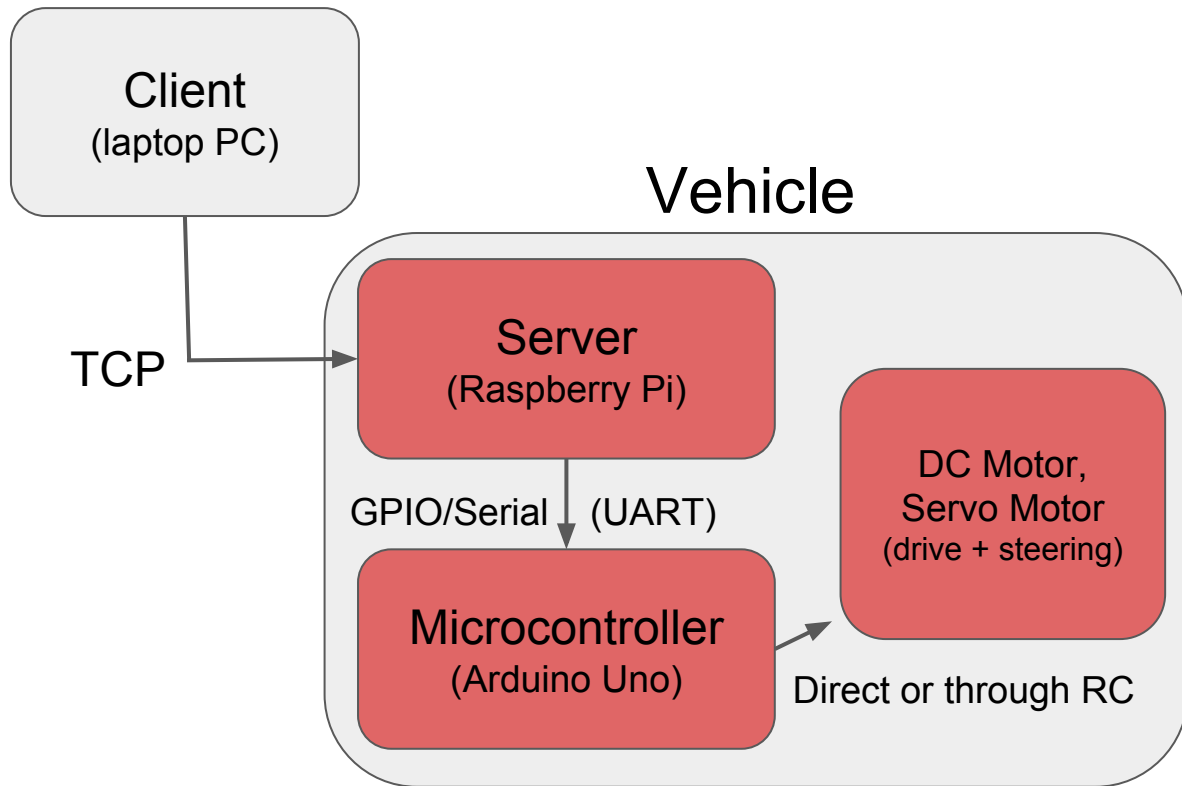

Chloe Fortuna, Shahrez Jan, Austin Small

Motivation

- Build a small computer-controlled vehicle suitable for various use cases
- Integrate various modern technologies into the vehicle and further understand which of these is appropriate for real-time / remote control of a vehicle

Approach

- **Client-server model**
- **Raspberry Pi as TCP webserver**
- **Arduino Uno as microcontroller for DC motor and servo**
- **Having the RPi on the vehicle may allow for more expansion in the future (perhaps machine vision libraries, etc)**

**If we have
time...**

- Autonomous driving mode
- Live video feed
- Desktop/Smartphone application
